

1) This list should start out populated with "Care at home" as soon as the text field gets focus. If possible, also pre-populate with nearby hospitals/ care facilities based on user's location. Once the user starts typing the list can be populated accordingly.

later on do some text recognition and offer advice / learning opportunities based on phrases or key words

- 1) This area can be used for a variety of messaging. For example, if the patient makes it until noon without updating their status then Barbara's messaging should prompt them to do so
- 2) mic should have some animated indication that it is active. if user hasn't spoken after a couple seconds then the animation stops, the icon is replaced with an obviously touchable version, and the messaging updates to say "Touch the mic then speak your concern"
- 3) once a message has been recorded the mic gets replaced with some iconography and messaging indicating success, and the text area disappears.
